The invention relates to human polynucleotides (AAI63803-AAI64012) and the encoded proteins (AAM434497-AAM43660) useful for preventing, treating to rameliorating medical conditions e.g. by protein or gene therapy. The genes were isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial isofanemias; od) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections diseases such as viral, bacterial, fungal cand parasitic infections diseases such as viral, bacterial, fungal cand parasitic infections diseases such as viral, bacterial, fungal cand parasitic infections diseases such as viral, bacterial, fungal cand parasitic infections diseases such as viral, bacterial, fungal cand parasitic infections.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip, wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GCCCGCGAGCCAGGCCGCCTTCTCCTCCTGATGCTTTTGCAGACCGCGCTCCTGCAGG 285

This genomic DNA sequence corresponds to the human gene whose mutated form is associated with hereditary haemochromatosis (HH).

To identify this novel gene, allelic association patterns were determined between known markers and the HH locus in the HLA region of chromosome 6. A physical clone coverage was then generated cterending from D6265, which is a marker that is centromeric of HLA-A, in a telomeric direction through D62576, a marker at which the allelic association was no longer observed. A single mutation the allelic association was no longer observed. A single mutation of sease. This comprises a G to A substitution that is present in 64 of isease. This comprises and in 4% of unaffected chromosomes. Tr results in a cys tor yr substitution in the encoded protein (see AAW36699) at a critical disulphide bridge important for secondary structure. The following are claimed; the HH genomic DNA (1), a structure. The following are claimed; the HH genomic DNA (1), a structure. The following of septide in the result is a condition of sequence (1a) (see AAM3699) and their 24d, 24d2 and 24d7, variants; a cloning or expression vector; host cells; a condition of sequence of the common HH gene of these; an antibody produced using the peptide; a method creating other and sequence of the common HH gene of the common in a minal model for the HH disease, metal holds in indigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process on vivo or the mitigation of injury due to oxidative process on vivo or the mitigation of injury due to oxidative process on vivo or the mitigation of injury due to oxidative process on vivo or the arrangements of an outleic and ordinal model for the HH disease, and ordinal scenering potential the HH gene. The invariants, useful for detecting a polymorleotide disease, mand and an ordinal model for the HH disease, including gene therep
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tggaaaatcacaaccacagcaagggtatgtggagagggggcctcaccttcctgaggttgt 4061

These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents the human histocompatibility iron loading (HFE) gene. The HFE gene is a major histocompatibility (MHC) non-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for disorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence given in A99769 (Genbank Accession number 160319). The presence of the mutation indicates the disorder or the genetic susceptibility to the disorder. The method is used to diagnose an iron disorder
                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing an iron disorder e.g. hemochromatosis or a genetic susceptibility to develop it, by determining the presence of a mutation in exon 2 or an intron of a histocompatibility iron loading nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       tgtttgaagctttgggctacgtggatgaccagctgttcgtgttctatgatcatgagagtc 4771

DNA or RNA for the presence or absence of a haplotype or genotype where the presence or absence of the haplotype genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BFF genes, which are homologues of the milk protein butyrophilin (BF), and can be used in the production of agonists and antagonists of BF function. Also described are: (1) a RORET gene treatment of lupus and Sigaren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type 1 sodium transport gene, and can similarly be used for hypophosphatemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AGCTGAGTCAGAGTCTGAAAGGGTGGGATCACATGTTCACTGTTGACTTCTGGACTATTA 537

products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3881

products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
